RESEARCH EXPERIENCE

SEPT. 2013– PRESENT	<i>Title: The Grism Lens-Amplified Survey from Space (GLASS) program</i> GLASS is a cycle-21 HST Large Program allocated 140 orbits of Grism spectroscopy assisted with HST optical/infrared imaging. We survey the core and infall regions of 10 massive galaxy clusters, including 8 targeted by CLASH and 6 Frontier Fields. We will address three scientific questions: 1) What's the role that galaxies play in the process of reionization? 2) Why and how is galaxy evolution environmental dependent? 3) How do metals cycle in and out of galaxies and what's the interplay between cycling of metals and SF activities? Project in progress and scientific product: Wang et al. (2018) , Wang et al. (2017) , Wang et al. (2015) , Jones et al. (2015)
SEPT. 2011– JUN. 2013	<i>Title: Constraints on Cosmic Neutrinos and Dark Energy Revisited</i> Using various cosmological observations, i.e., CMB, weak lensing (WL), BAO, observational Hubble parameter data (OHD), type Ia supernovae (SNIa), we impose constraints on the sum of neutrino masses (Σm_ν), the effective number of neutrino species (N_{eff}) and dark energy equation of state (w). We find that a tight upper limit on Σm_ν can be extracted if N_{eff} and w are fixed, however it will be severely weakened if N_{eff} and w are allowed to vary. This result raises questions on the robustness of previous strict upper bounds on Σm_ν , reported in the literature. The different constraining abilities of current WL, OHD and SNIa samples are assessed and compared. Scientific Product: Wang et al. (2012) , Wang et al. (2013)
SEPT. 2008– JUN. 2010	<i>Title: Investigation on the Emission from the Receding Jet of Gamma-Ray Bursts</i> We studied the dynamical evolution of double-sided jets launched by the central engine of GRBs and calculated the afterglow emission from both jet components. For the first time, we present a detailed numerical study on the afterglow contributed from the jet component receding from the observer, with the effects of synchrotron self-absorption and equal arrival time surface taken into account. It is found that the receding jet emission is generally very weak and only manifests as a plateau in the late time radio afterglow light curves. However the emission from the receding jet can be significantly enhanced and possibly detectable, if the circum-burst medium density is high. Scientific Product: Wang et al. (2009) , Wang et al. (2010)
